

Safehouse Code Convention

Languages used: JavaScript

Variables/Function names: camelCase convention, and should make sense

Braces Convention:

```
method(foo) {  
  if (condition(foo)) {  
    try {  
      // Note: this might fail.  
      something();  
    } catch (err) {  
      recover();  
    }  
  }  
}
```

Indentation: Two spaced

Semicolons needed at end of each line of code

File name convention: First letter of each word is capitalized, only ASCII characters

Note:

- Try to avoid comments, make the actual code reveal its functionality clearly
- Avoid creating algorithms that are slower than $O(n^2)$
